

security devices. With several users authorised to execute transactions with multiple banks, the number of tokens, passwords and processes quickly add up.

3SKey is a direct response to their needs. Just one token with a single password is sufficient to execute transactions securely with multiple institutions in multiple countries.

3SKey step-by-step:

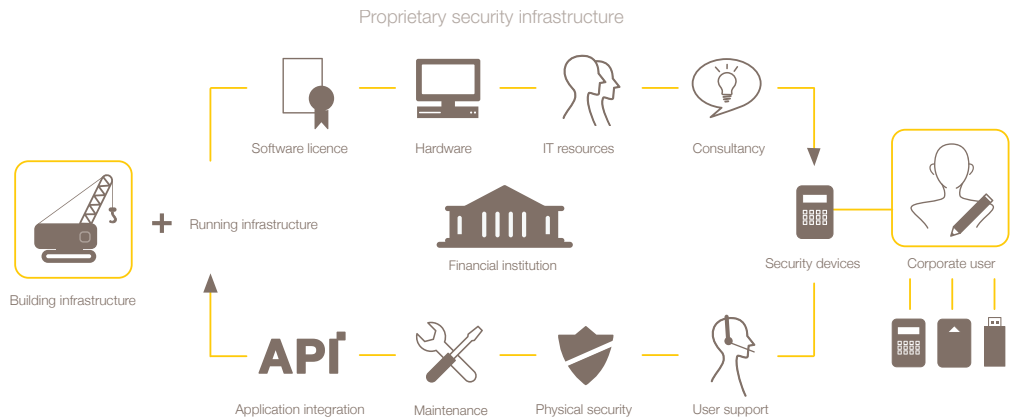

- 1. Subscribe to the 3SKey service:** Subscribed banks may use the service across their subsidiaries in all countries.
- 2. Integrate 3SKey in bank applications:** 3SKey integration toolkits and APIs are available for flexible and rapid integration.
- 3. Register corporate user:** Banks provide the 3SKey tokens to their customers and associate their identity with the token.

3SKey is now ready to use:

3SKey digital signatures ensure that the data is coming from the attributed corporate user, that the content has not been changed after the approval process and represent a proof of signature.

Before 3SKey

Implementing an identity management solution requires banks to invest in a solid infrastructure with considerable running and maintenance costs. They also need to keep up to date with new security threats and evolving technology.

3SKey infrastructure

With 3SKey

3SKey provides a common solution for strong authentication and digital identity, preventing the need to invest in proprietary security management technology.
